

CHAPTER 7

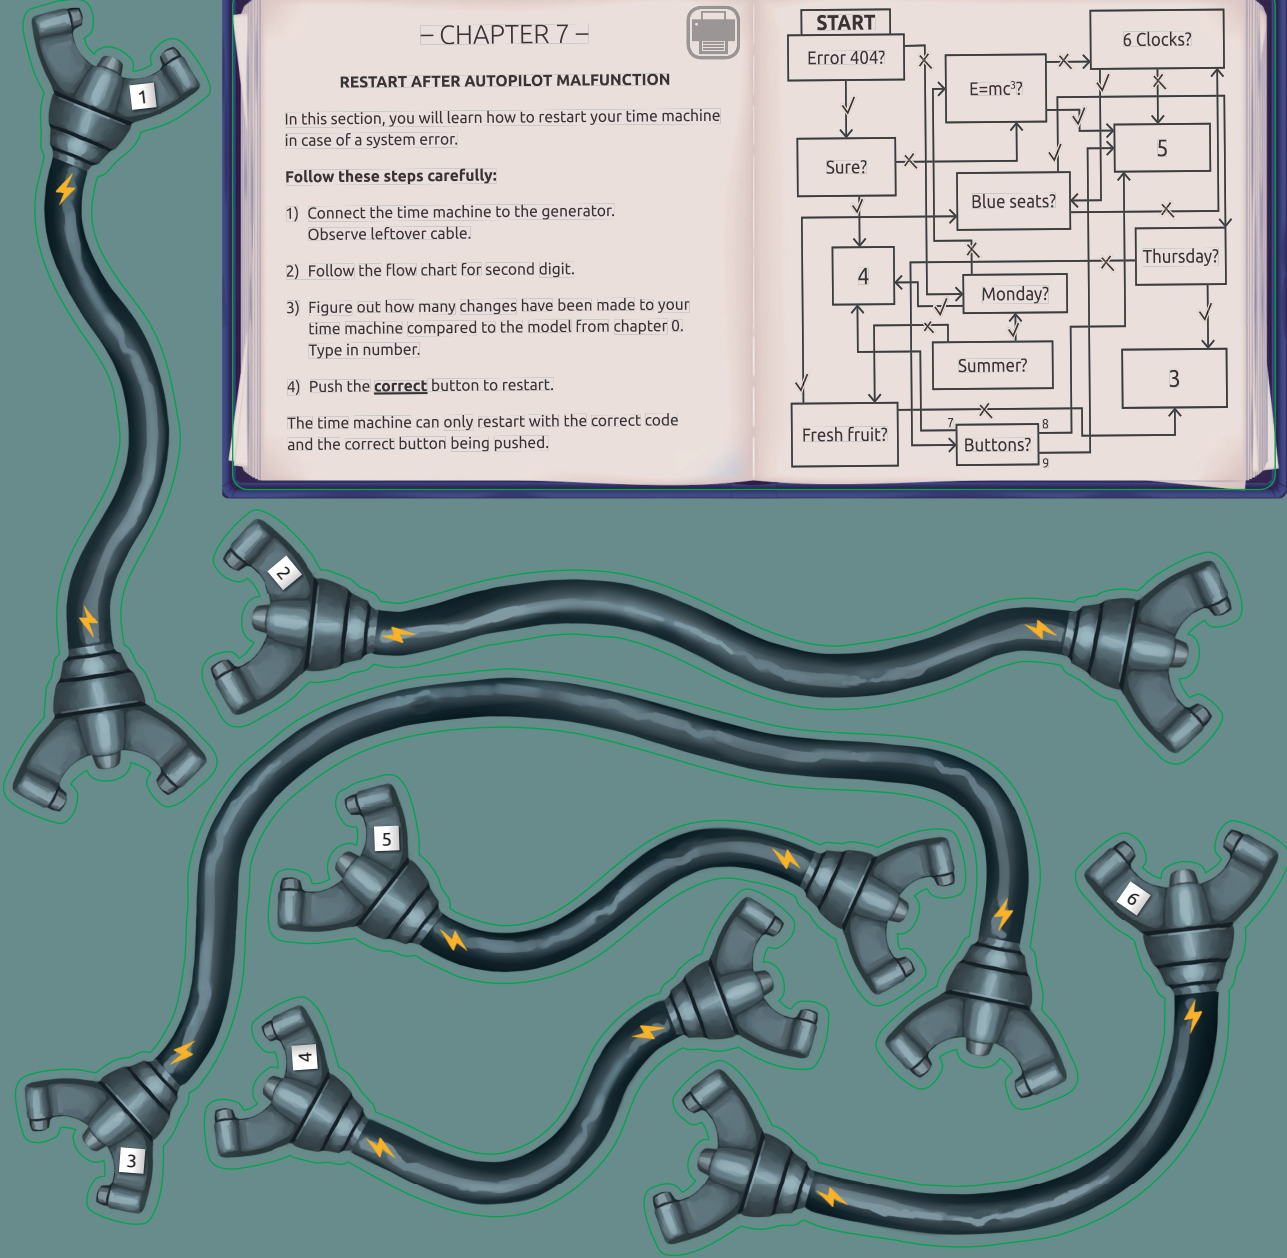

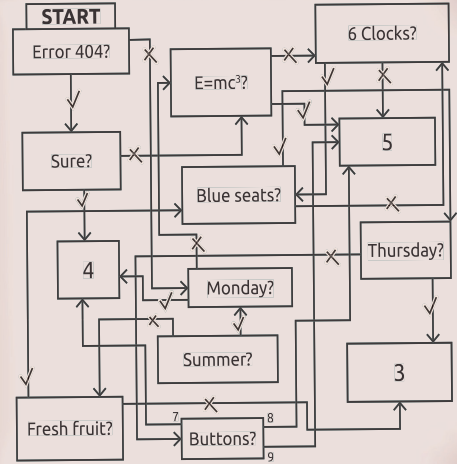

RESTART AFTER AUTOPILOT MALFUNCTION

In this section, you will learn how to restart your time machine in case of a system error.

Follow these steps carefully:

- 1) Connect the time machine to the generator. Observe leftover cable.
- 2) Follow the flow chart for second digit.
- 3) Figure out how many changes have been made to your time machine compared to the model from chapter 0. Type in number.
- 4) Push the **correct** button to restart.

The time machine can only restart with the correct code and the correct button being pushed.

— CHAPTER 0 —

The image on the right page depicts the primary set-up of the time machine. This set-up can be adjusted if needed. We advise to keep a summary of all changes made, to permit a quick restart in case of an emergency.
